Narrative Report: Building the Workshop Attendance App

Overview

For this activity, I developed a mobile-friendly Workshop Attendance Log using Google AppSheet. The goal was to create a practical tool that replaces manual sign-in sheets with a digital system capable of scanning student IDs in real-time.

The Process

I started by linking my app to a Google Sheet titled "Workshop_Attendance_Log". Since the file was originally shared with me, I had to first organize it by adding a shortcut to "My Drive" so AppSheet could access it as a data source. Once connected, I moved into the **Data** settings to configure how the app handles information:

- **LogID:** I used the **UNIQUEID("UUID")** formula here to make sure every entry has its own distinct identity.
- **Timestamp:** I set this to **NOW()** so the app automatically records the exact date and time a student scans in.

- **QR_Scan:** I configured this column to act as the scanner, allowing the phone's camera to read student ID codes.

Challenges and Adjustments

One of the main hurdles was making sure the app felt like a scanner and not just a spreadsheet. Initially, the app displayed a simple list, which isn't very helpful for quick data entry. To fix this, I adjusted the **UX** settings to change the view type to a **Form**. This adjustment ensures that as soon as the app opens, it's ready to take a new scan, making the process much faster for the user.

Key Takeaways

This project taught me a lot about the power of "no-code" tools. I learned that:

- **Automation is key:** Using formulas for IDs and timestamps removes the need for manual typing and reduces the chance of mistakes.
- **Design matters:** Changing the interface to a "Form" view completely changed how the app functions, turning it into a specialized tool rather than just a data viewer.
- **Cloud flexibility:** Being able to turn a simple Google Sheet into a mobile app that works on a phone is a huge advantage for organizing events on the go.

Conclusion

The final app is a fully functional attendance system. By setting up the right data rules and choosing a user-friendly layout, I created a tool that is ready to be used in a real classroom or workshop setting.
